

■ WebDefence Technology Overview

BlackSpider WebDefence is an on-demand service from SurfControl that provides comprehensive and flexible protection against web threats such as viruses, spyware and phishing attacks as well as controlling employee web access.

Managing the secure and efficient usage of the web is vital to ensure that it is an effective business and communications tool. WebDefence provides everything an organisation requires in order to define and enforce all aspects of web security and usage policies. Huntsman intelligent threat prevention provides comprehensive and constantly updated protection from web threats including blended attacks. Close integration with BlackSpider MailControl enables seamless control of web and email communications security.

WebDefence Access Manager

The ability to understand, define and enforce acceptable employee Internet usage is critical to the web being a valuable business tool without representing a threat to staff productivity, network resource availability or increased legal liability.

WebDefence Access Manager enables an organisation to define detailed and flexible web access policies based on website categories. This level of control ensures that recreational surfing is minimised, network resources are optimised and staff are protected from illegal or undesirable content. Comprehensive and accurate URL classification is assured through the continuously updated database of over 70 categories containing millions of URLs.

WebDefence Threat Manager

WebDefence threat prevention technology delivers comprehensive protection against the constantly evolving web based threats of viruses, trojans, worms and other malware that present a real business risk.

All web connections and webmail are filtered through world-class and continuously updated anti-virus and spyware filters to remove known malware. In addition, BlackSpider's Huntsman intelligent threat prevention technology provides an extra level of advanced heuristic-based protection. Huntsman analyses and correlates real-time HTTP, FTP and SMTP threat data from multiple sources. WebDefence uses this intelligence to scan web traffic to block suspicious activity before it impacts the business.

Comprehensive management

WebDefence empowers administrators with a suite of integrated management and reporting capabilities that enables effective policy definition, enforcement, monitoring and reporting.

Initial deployment is easy with no hardware or software required and minimal integration. Granular policies can be defined for the whole organisation or down to an individual user. Real-time visibility of web traffic and threat data together with the ability to make policy changes in

real-time ensures that web security management matches the dynamic needs of the business.

Comprehensive reporting enables detailed analysis of web threats, network resource usage and user activity. Close integration with BlackSpider MailControl provides the benefit of common management and reporting tools for administrators to seamlessly control comprehensive security policies covering both the web and email.

Key Benefits of WebDefence

- Protect against web based threats including viruses, trojans, worms and phishing attacks
- Prevent lost productivity through unauthorised or excessive employee web usage
- Protect employees from illegal or inappropriate web content
- Protects webmail against malware threats
- Reduce legal liability from having illegal content in your network
- Reduce IT costs by optimising network bandwidth availability
- Easy, flexible and low cost deployment with no hardware or software required and minimal integration
- Single solution for multiple sites with no single point of failure
- Minimised total cost of ownership
- Close integration with BlackSpider MailControl for seamless web and email security management
